26^e Anniversaire de l' OCT

Vitesse de scan (*A-scans per second*): 100 A-scans/sn ➡ 200,000 A-scans/sn

Résolution axial: 12 μm ➡ 4-5 μm

Résolution longitudinale (*A scan / B scan*): 128 ➡ 4096

Enregistrement du signal de réflexion sous forme de pics d'amplitude variable comparable à un
« **écho A** » (on utilise la lumière et non les Ultrasons) ➡ **A-Scan**

OCT 3

- L'image en OCT3 est composée de 512 (résolutions à 128 & 256 possibles) *A*-scans successifs en 1,28 sec
- Résolution longitudinale d'environ 8-10 μ m

Swept Source OCT (SS-OCT)

Spectral discrimination by fourier-domain OCT. Components include: low coherence source (LCS), beamsplitter (BS), reference mirror (REF), sample (SMP), diffraction grating (DG) and full-field detector (CAM) acting as a spectrometer, and digital signal processing (DSP)

Spectral discrimination by swept-source OCT. Components include: swept source or tunable laser (SS), beamsplitter (BS), reference mirror (REF), sample (SMP), photodetector (PD), digital signal processing (DSP)

SD-OCT & SS-OCT

- Vitesse d'acquisition
 - 80 000 à 100 000 A-scans/sec
 - 100 000 à 200 000 pour le SS-OCT
- Résolution axiale
 - 5-7 μm
 - 6,3 μm le SS-OCT (Cirrus)
- Meilleure résolution longitudinale (A scan / B scan)
 - 128 lignes x 512 pts (Cirrus)
 - 400 lignes x 400 pts (Optovue)

Critères pour obtenir une bonne qualité des examens (1)

Avant de capturer une image, suivez ces directives afin d'optimiser la qualité des images.

1. L'image de l'iris :

- Centrez l'image de l'iris à l'intérieur de la pupille (celle-ci peut être légèrement déplacée en fonction de l'inclinaison de la rétine ou afin d'éviter l'opacité).
- Centrée sur le détail de l'iris.

2. L'image du fond d'oeil :

- La focalisation doit être forte et claire, de préférence avec une bonne visibilité de la ramification des vaisseaux sanguins.
- Centrez le calque d'examen sur la fovéa pour les examens maculaires et sur la tête du nerf optique pour les examens de disque optique.
- Assurez un éclairage uniforme sans les coins sombres.
- Il n'y devrait pas avoir d'artéfacts ou, le cas échéant, il y devrait en avoir peu, car ceux-ci peuvent jeter des ombres sur les examens OCT.
- L'image en-face OCT doit avoir un minimum de saccades et pas de saccades à travers la zone d'intérêt (macula, par exemple).
- Les corps flottants peuvent être souvent déplacés en demandant au patient de changer les yeux avant de la capture d'image.
- Les opacités cornéennes peuvent être minimisées par le réalignement de la Pupille

Critères pour obtenir une bonne qualité des examens (2)

3. L'examen OCT :

- Centrez l'examen OCT dans la partie moyenne vers supérieure de l'écran d'acquisition d'examen.
- L'examen OCT de type B doit être complet dans toutes les fenêtres, sans données manquantes.
- La densité des couleurs devrait être la même de bout en bout.
- La force du signal devrait être 6 ou supérieure.
- Une rétine inclinée peut être corrigée par le déplacement de la pupille hors du centre de l'alignement pour permettre un niveau plus grand de l'examen OCT.
- Ajustez le réglage d'amélioration pour obtenir le plus brillant et le plus clair examen.

CIRRUS HD-OCT (Zeiss)

Image FO: SLO

Source optique : superluminescent diode (SLD), 840 nm

Puissance optique: < 725 μ W à l'entrée

Vitesse d'examen: **100,000 A-scans per second**

Profondeur A-scan : 2.0 mm (dans les tissus), 1024 points

Résolution axiale : 5 μ m (dans les tissus)

Résolution transversale: 15 μ m (in tissue)

Champs de vision: 36 degrees W x 30 degrees H

FastTrac™ ++

- OCT 1 (1996)

- OCT2 (1999)

- OCT3 (2002)

- Cirrus (2007)

- PlexElite 9000 (2016)

Cirrus obtains up to 200 B-Scans along a 6 x 6 mm box in less than 2 seconds, creating a 3D cube with minimal data interpolation

Protocole d'acquisition pour Cube Maculaire (*CIRRUS 5000*)

- **Macular Cube (3D-Scan)** – génère deux types de scans :

- **Cube Scan 6mm x 6 mm**

- 128 B-scans X 512 A-scans
- 200 B-scans X 200 A-scans

- **HD Cross Hair Scan**

- 2 B-scans of 1024 A-scans each (part of the cube package, acquired automatically with the Macula Cube – do not need to be acquired separately) for Macular Cube 512x128

Click on icon to toggle
between HD-Cross hair and
standard view

Fenêtre d'acquisition pour Line Raster (CIRRUS 5000)

The screenshot displays the acquisition interface for the CIRRUS 5000 Line Raster. The interface is divided into several sections:

- Top Left:** A list of scan patterns: Macular Cube 512x128, Macular Cube 200x200, **HD 5 Line Raster** (highlighted), 5 Line Raster, and Optic Disc Cube 200x200.
- Top Right:** A duplicate of the scan pattern list.
- Left Panel:** Contains a live video feed of an eye with a red crosshair in the pupil. Below it is a fundus image showing the retina with a green crosshair and a magenta rectangular area indicating the scan path. Navigation controls include a 'Chinrest' icon, 'Repeat Setup', 'Auto Focus', and a 'Focus' slider with a transparency control.
- Right Panel:** Displays 'Enhance' and 'Center' sliders, and a series of four cross-sectional OCT scan images showing retinal layers in color (blue, green, yellow, red).
- Bottom Section:** Three 'Custom Scan Pattern' dialog boxes are shown, each with the following parameters:
 - Rotation: 0 (range 0-90, 270-359 degrees)
 - Length: 6 (mm)
 - Spacing: 9 (mm)The third dialog box has an expanded 'Spacing' dropdown menu showing values: 0, 0.01, 0.025, 0.05, 0.075, 0.125, 0.2, 0.25, 0.5, 1.25. A red arrow points to the 0.25 value, labeled 'Valeur par défaut'.

Red arrows indicate the flow of information: from the 'HD 5 Line Raster' selection to the 'Custom Scan Pattern' dialog, and from the 'Custom Scan Pattern' dialog to the 'Spacing' dropdown menu.

Modes d'acquisition (SPECTRALIS-HEIDELBERG)

Possibilité d'extension avec l'angio confocal-SLO HRA2 afin de confronter différents types d'imagerie (6 modes) :

- Vitesse d'examen: 85,000 A-scans per second
- OCT
- angiographie à la fluorescéine
- angiographie au vert d'Infracyanine
- autofluorescence
- Red Free
- Infrarouge
- Multicolor
- OCT-A

Fonctionnalités particulières :

- L'ophtalmoscope à balayage laser confocal (cSLO)
- Technologie de réduction du bruit (Heidelberg Noise Reduction Technology™)
- Système de moyennage automatique en temps réel des images (ART ou Automatic Real Time, 1 à 100)
- Eye tracking** (TruTrack™ Technology) : suivi des mouvements oculaires, maintien de la position du scan sur la rétine durant l'examen
- Autorescan (Repositionnement automatique du scan sur l'emplacement de l'examen initial).
- C'est le seul système permettant de placer un scan OCT sur une image d'angiographie acquise simultanément.

Eye tracking + Repositionnement automatique du scan sur l'emplacement de l'examen initial

Bonne reproductibilité

Mode haute résolution (*High Resolution Mode*)

Résolution numérique (μm) : 3.8 axial x 6 latéral

Résolution optique (μm) : 7 axial x 14 latéral

Diamètre pupillaire minimum : 2.5 mm

Vitesse de balayage : 80 000 A scan / sec

Cibles de fixation : interne et externe

Model de scan linéaire :

- Taille de l'image (pixels) : (1536 x 496) / (1024 x 496) / (768 x 496)
- Temps d'acquisition mini (ms) : 39 / 26 / 19

Model de scan circulaire :

- Taille de l'image (pixels) : (1535 x 496)
- Temps d'acquisition mini (ms) : 52

Model de scan en étoile :

- Diamètre (°) : 30 / 20 / 15
- Nombre de coupes : 48 / 24 / 12 / 6 / 4 / 2

Model de scan en volume :

- Etendu horizontal (°) : 30 / 20 / 15
- Etendu vertical (°) : 25 / 20 / 15 / 10 / 5
- Nombre de coupes par scan de volume : 7 à 241 (\updownarrow 240 μm à 30 μm)

Volume Scan à 193 lignes

The screenshot displays the Heidelberg Engineering HRA+OCT Spectralis software interface. The main window is divided into several sections:

- Top Left:** A large black area labeled "IR Reflection Image" showing a blue grid pattern with a central white spot.
- Top Right:** A large black area showing a dense, noisy pattern, likely representing the OCT volume scan data.
- Bottom Left:** A "Settings" panel with fields for Eye (OD, OS), Angle (30°), Focus (2.75 D), Sens. (59), Power (IR 100%), Mode (OCT Volume), Rate (4.7/sec), and Res. (High Res.).
- Bottom Left (Continued):** A "Timers" panel with fields for ICGA, FA, and Memory (Images: 0, Free: 999 MB).
- Bottom Center:** A "CIRRUS-Volume Scan" section with parameters: - 6mm x 6mm, - 128 lignes X 512 A-scans (46.9µm).
- Bottom Right:** A "Scan" panel with controls for ART (20 frames), Angle (0.0°), and a 20° x 20° field of view. It also shows "193 sections" and "1024 A-scans".
- Bottom Right (Continued):** A "Follow-Up" panel with buttons for "Retina", "Fast", "Dense", "Detail", "P.Pole", "7Lines", "Map HD", "Scan", "Custom", and "Custom".
- Bottom Right (Continued):** A "Scan" panel with buttons for "Scan", "OCT Control", "EDI", and "Scan".
- Bottom Right (Continued):** A "Scan" panel with buttons for "Scan", "OCT Control", "EDI", and "Scan".
- Bottom Right (Continued):** A "Scan" panel with buttons for "Scan", "OCT Control", "EDI", and "Scan".

The interface is branded with "HRA+OCT SPECTRALIS" and "HEIDELBERG ENGINEERING" logos.

Protocole d'acquisition

toujours les deux yeux

L'examen standard OCT pour une première fois doit comporter

- cube 6x6
- 2 raster lignes 9 mm H + V séparées de 75 μ sur le *Cirrus* , ou 2 lignes simples 9x9 H+V sur *Spectralis* toujours EDI

ou : radial lignes

- 1 ligne 12 mm papille macula
- RNFL + CG

Coupes additionnelles selon pathologie

- Exploitation post acquisition (segmentation ILM , CC etc..) selon pathologie
- Suivi : toujours recommencer les coupes précédentes + coupes additionnelles si nécessaire

On peut créer les icône préréglés en « CUSTOM »

1. Après avoir entré les paramètres pour le 1er examen
2. Rester appuyé sur l'icône « Custom »
3. Puis renommer l'icône

4. Faire la même chose pour chaque examen
5. A

Dans tous les cas il faudra définir l'examen de référence pour 3 examens en OCT lors de la 1^{re} visite pour pouvoir réaliser les examens en mode « REPEAT »

Pour les examens de suivis, il faudra cliquer sur « Follow-Up » et choisir l'examen de référence de la 1^{re} visite

Permet de suivre l'évolution spontanée et traitée de l'OM

Detection of diabetic neovascularisation using single-capture 65°-widefield optical coherence tomography angiography

Heiko Stino ¹, Michael Niederleithner, ² Johannes Iby ¹, Aleksandra Sedova, ¹ Thomas Schlegl, ² Irene Steiner, ³ Stefan Sacu, ¹ Wolfgang Drexler, ² Tilman Schmolz, ^{2,4} Rainer Leitgeb, ² Ursula Margarethe Schmidt-Erfurth ¹, Andreas Pollreisz ¹

Br J Ophthalmol 2022

Une image (WF-SS-OCTA) à 65° avec un diamètre de 18mm réalisée avec un système **PlexElite** modifié (développé par le Centre de physique médicale et d'ingénierie biomédicale de l'Université médicale de Vienne) est comparée à l'angiographie à la fluorescéine à champ ultra-large (UWF-FA)

Examen des scans B de l'OCTA à la recherche de NV, visibles comme des signaux de flux sanguin franchissant la membrane interne, a révélé une sensibilité de 0,95 de 0,95 pour le diagnostic du PDR. Sur l'UWF-FA, la majorité des NV (63 %) étaient situés dans les quadrants dans les quadrants temporaux, 93 % d'entre eux étant détectés en utilisant la WF-OCTA à capture unique.

La sensibilité élevée de la WF-OCTA à capture unique dans le diagnostic de la RDP par rapport à l'UWF-FA peut améliorer la prise en charge clinique des patients atteints de diabète. La WF-OCTA 65° à capture unique, rapide et non invasive, a le potentiel de remplacer l'UWF-FA en tant qu'outil de diagnostic unique.

OCT/OCTA

Artéfacts

Les artefacts peuvent avoir une origine triple

- ✓ Liés au patient:
 - trouble des milieux (cataractes, hémorragies intra vitréennes / sous rétiniennes, corps flottants)
 - mouvements oculaires
 - mauvaise fixation...
- ✓ Liés à l'opérateur (l'acquisition):
 - mauvais positionnement du scan et/ou du choix de protocole d'examen
- ✓ Liés à l'appareil et au logiciel de traitement d'image:
 - erreurs de mesure de l'épaisseur , sommations, eye tracking, segmentation ...

OCTA & Artéfacts

Displacement artifact: artefact de déplacement

Provoqué par les mouvements oculaires pendant le scan. L'image en face semble discontinue le long de la direction du B-scan.

False-negative flow : fausse absence de flux

Les signaux OCTA avec une décorrélation basse suggèrent l'absence de flux, alors que le flux existe réellement. La décorrélation peut être trop faible au cours de l'intervalle mesurant le flux, pour mettre en évidence ce flux. Une atténuation du signal pouvant être lié à des opacités des milieux peut aussi entraîner des faux négatifs. (exemple : μanévrismes)

False positive flow : fausse présence de flux

Un signal OCTA avec une forte décorrélation suffit à montrer un flux dans des situations où il n'y en a pas, ou peu. Ceci peut être du bruit au niveau de l'image ou à des microsaccades oculaires. (exemple: exsudats)

Projection artifact : artefacts de projection

L'un des plus importants artéfacts en OCTA. La lumière incidente sur un vaisseau sanguin peut être réfléchiée en arrière, ou dispersée, ou réfractée. La lumière qui passe à travers le vaisseau fluctue au cours du temps et n'importe quelle structure en arrière du vaisseau peut être « illuminée » par cette lumière fluctuante. Les techniques utilisant le contraste des mouvements détectent les fluctuations au cours du temps, donc des images artéfactuelles des vaisseaux peuvent être vues à des localisations plus profondes dans l'œil que leur réelle position.

Gap defect : lacunes

Une perte d'information au niveau d'une région de l'image, résultant d'un mouvement oculaire, peut exister dans les données de l'image brute, ou dans les images traitées par le logiciel (correction des mouvements oculaires).

Segmentation artifact : artefact de segmentation

IMAGE ARTIFACTS IN OPTICAL COHERENCE TOMOGRAPHY ANGIOGRAPHY

RICHARD F. SPAIDE, MD,* JAMES G. FUJIMOTO, PhD,† NADIA K. WAHEED, MD‡

Purpose: To describe image artifacts of optical coherence tomography (OCT) angiography and their underlying causative mechanisms. To establish a common vocabulary for the artifacts observed.

Methods: The methods by which OCT angiography images are acquired, generated, and displayed are reviewed as are the mechanisms by which each or all of these methods can produce extraneous image information. A common set of terminology is proposed and used.

Results: Optical coherence tomography angiography uses motion contrast to image blood flow and thereby images the vasculature without the need for a contrast agent. Artifacts are very common and can arise from the OCT image acquisition, intrinsic characteristics of the eye, eye motion, image processing, and display strategies. Optical coherence tomography image acquisition for angiography takes more time than simple structural scans and necessitates trade-offs in flow resolution, scan quality, and speed. An important set of artifacts are projection artifacts in which images of blood vessels seem at erroneous locations. Image processing used for OCT angiography can alter vascular appearance through segmentation defects, and because of image display strategies can give false impressions of the density and location of vessels. Eye motion leads to discontinuities in displayed data. Optical coherence tomography angiography artifacts can be detected by interactive evaluation of the images.

Conclusion: Image artifacts are common and can lead to incorrect interpretations of OCT angiography images. Because of the quantity of data available and the potential for artifacts, physician interaction in viewing the image data will be required, much like what happens in modern radiology practice.

RETINA 35:2163–2180, 2015

The artefacts are more frequent in eyes with pathology.
They should be known and avoided.

Motion Correction Technology (MCT)

motion artifact, blinks, shadowgraphic flow projection, vessel duplication, and vessel discontinuity...etc

Condensation vitrénne

Hémorragies

The vast majority of soft drusen produce shadowing artifacts in the structural en-face OCT CC images that allow neither a qualitative nor a quantitative flow evaluation under drusen in SD OCT-A.

Signal reduction in choriocapillaris and segmentation errors in spectral domain OCT angiography caused by soft drusen

*A practical guide to optical coherence tomography angiography interpretation
Greig et al. International Journal of Retina and Vitreous, 2020*

OCTA Interpretation Toolkit. How to apply step-by-step OCTA interpretation toolkit in a patient with AMD.

Step 1: Image the right spot. Color fundus photograph of a patient with known AMD, the macula was selected as the area of interest and imaged.

Step 2: Look at the en face OCTA images. 3×3 mm en face projections of each the full retinal depth, the avascular slab and the choriocapillaris (from left to right). The avascular and choriocapillaris slabs should be assessed in this AMD patient to check for presence of MNV. Note clearly defined vascular structures in the choriocapillaris slab (right most image), this is concerning for a type 1 MNV.

Step 3: Look at the segmentation lines. Segmentation is assessed at multiple points throughout the slab to ensure accuracy.

Step 4: Look at the B-scan with flow overlay. B-scan through lesion shows clear flow below the RPE (white arrow) and no projection artifact from overlying vasculature, suggesting this is in fact an MNV.

Step 5: Look at the en face intensity image. En face intensity image for the choriocapillaris slab shows strong signal, shadowing artifact is not expected to disrupt image interpretation.

Summary: Methodical OCTA image analysis uncovered a type 1 MNV that was not visible on fundus examination or on full depth retinal projection

Conclusion

- **Bonne compréhension des artefacts existants**
- **En corrélation avec l'imagerie multimodale**
- **La visualisation combinée des images OCTA et OCT (B-scans, en-face, lignes de segmentation) devrait réduire considérablement le risque de mauvaise interprétation tout en fournissant des informations plus complètes sur les pathologies rétiniennes.**
- **Les améliorations apportées aux logiciels informatiques automatisés pour la segmentation anatomique, la détection pathologique et la quantification rendront OCTA plus facile à utiliser**
